

A PROJECT REPORT

ON

**GHUMANTEY: An application to Build Online Platform for
booking guide**

Submitted To:

Department of Computer Science and Multimedia

National College of Management and Technical Science

Samakhushi, Ranibari,

Kathmandu, Nepal

Submitted By:

Mr. Rahul Parajuli

*Submitted in partial fulfillment of the requirements for the BIT 7th Semester Final
Project.*

Date: December 2025

Kathmandu, Nepal

RECOMMENDATION

CERTIFICATE FROM SUPERVISOR

We, the undersigned, certify that we have read and hereby recommend for acceptance by the NCMT College, Lincoln University College, Final Year Project (FYP) report submitted by Mr. Rahul Parajuli entitled “Ghumantey: A Digital Tourism Platform for Nepal”, in partial fulfillment of the requirements for the award of the degree of Bachelor of Information Technology (Hons) of Lincoln University College, Malaysia.

Mr. Kapil Shrestha

Project Supervisor

Vice-Principal, NCMT College

Date: April 2025

DECLARATION OF AUTHENTICITY

I, Rahul Parajuli, declare that this final year project entitled “Ghumantey: A Digital Tourism Platform for Nepal” is my own original work and that it has fully and specifically acknowledged wherever adapted from other sources. I also understand that if at any time it is shown that I have significantly misrepresented material presented to the Faculty of Computer Science and Multimedia, Lincoln University College, any credits awarded to me on the basis of that material may be revoked. Diploma.

Rahul Parajuli

May 2026

ACKNOWLEDGEMENT

The FYP report, titled “**Ghumantey: A Digital Tourism Platform for Nepal**”, was prepared in partial fulfillment of the requirements for the degree of Bachelor of Information Technology (Hons) at Lincoln University. I extend my deepest gratitude to my esteemed supervisor, **Mr. Kapil Shrestha**, whose scholarly guidance, unwavering encouragement, and insightful feedback transformed this dissertation into its final form.

I also wish to express my heartfelt appreciation to all those who made this endeavor possible. My profound thanks go to my parents, family, and closest friends for their constant presence, moral support, and boundless affection throughout my thesis. Finally, I sincerely thank BIT Coordinator Mr. Roshan Bhatta, along with the entire faculty and staff of NCMT College, for their guidance, encouragement, and unwavering support, which proved indispensable to the completion of this work.

Sincerely,

RAHUL PARAJULI

EXECUTIVE SUMMARY

Ghumantey is a platform for tourism and travel in Nepal. It helps people who are traveling to discover and navigate the country. The platform connects tourists with service providers who have been verified. Ghumantey has a backend built with Java Spring Boot and a user-friendly frontend built with Tailwind CSS. This helps to bring different parts of the local travel sector that were not connected before. The platform has information about hotel accommodations, adventure logistics and certified guides in one place. This helps to remove costs that tourists would normally pay to middlemen. It also makes sure that all financial transactions are transparent. The people who built Ghumantey thought a lot about security and automation. They wanted to make sure that the platform is safe and easy to use for vendors and visitors from other countries. The platform has a payment system that includes local payment options like eSewa. This system uses a verification process to make sure all transactions are safe. The user dashboard is also very secure. Has features like email verification to help users recover their accounts. Ghumantey also has a travel assistant that uses artificial intelligence to help users navigate and book their trips. This assistant looks at the users itinerary. Provides real-time help and support. The main goal of Ghumantey is to help the economy in Nepal. The platform does this by giving visibility to independent guides and remote communities. It charges commissions and lets vendors communicate directly with tourists. This makes sure that the money from tourism goes directly to the people. Ghumantey makes it easier for people to plan their trips to Nepal. It brings the country's tourism sector into the digital age. The platform is good for both the people and the tourists. It helps people to have an experience when they visit Nepal. Ghumantey is a tool for anyone who wants to travel to Nepal. It has a lot of features that make it easy to use and navigate. The platform is very helpful for people who want to explore the country and its culture. Ghumantey is the way to experience Nepal.

CHAPTER 1

INTRODUCTION

1.1 Background

Every year, Nepal receives many visitors. For Nepal, tourism is very important. Finding trustworthy guides and authentic local experiences is a challenge for visitors to Nepal. Many individuals still reserve guides by hand, which can lead to issues because people don't trust or understand one another. For travelers, this may be somewhat unpredictable. Ghumanthey is a computer program that allows users to reserve guides. Ghumanthey was designed to address these issues. It facilitates connections between travelers and professional Nepali guides. Travelers can examine the guides' strengths and the opinions of others. They can examine the material in the handbook as well. Make a computer reservation for them. Nepal is becoming a destination for convenient and environmentally friendly tourism because to this method. Additionally, it is improving the traveler's experience. People in Nepal are finding work as a result. Nepal has a tourism industry. Ghumanthey is assisting Nepal's tourism industry.

1.2. Problem Statement

We frequently run into significant issues when visiting new locations, which makes it difficult to really enjoy the trip. Finding a reliable local guide who can show us around and provide us with correct information is one of the biggest challenges. It can be difficult to arrange our calendars and meet at the appropriate time, even when we find a guide. This can lead to a great deal of tension and uncertainty. Furthermore, it can be very difficult to find a hotel that works with our schedule and travel plans. Travelers frequently have to deal with unforeseen delays, scheduling issues, and unreliable services because there isn't a single platform that can assist us with all of these things. To make traveling easier and more pleasurable, we need to find a solution to overcome these challenges and make it easy for people to organize their journeys and find trusted guides and accommodation. In addition to making travel less stressful, this would also ensure tourists' safety and enhance the

authenticity and immersion of their travels. By doing this, we can improve passengers' experiences and help them make the most of their vacations.

1.3. Objectives

The goal of the Ghumantey initiative is to establish a central hub for digital tourism in Nepal. Its primary objective is to facilitate vacation planning by connecting tourists with reputable local guides, lodging facilities, and tourism services. By doing this, the project seeks to encourage tourism that is transparent, safe, and sustainable—all of which are beneficial to all parties. Travel planning will be made easier for travelers by this platform, which will assist them in locating trustworthy and verified services. In addition to supporting regional companies and communities, it will boost the nation's economy and protect its natural and cultural assets.

The specific objectives of the project are:

- To develop a secure web-based platform for booking verified tourist guides and accommodation services.
- To provide travelers with reliable tourism information and destination recommendations.
- To integrate an AI-powered chatbot for assisting users with travel-related queries and trip planning.
- To implement secure online payment functionality through the eSewa payment gateway.
- To create an administrative dashboard for managing users, bookings, guides, hotels, and system activities.
- To support local tourism businesses and guides by providing them with a digital marketplace for service promotion.
- To enhance user experience through a responsive and user-friendly interface accessible across multiple devices.

1.4 Scope of the Project

The scope of the Ghumantey project focuses on developing a comprehensive digital tourism management platform designed to centralize and facilitate seamless

interaction between travelers and tourism service providers in Nepal. Built as a responsive web interface optimized for both desktop and mobile devices, the platform incorporates a robust suite of features including secure user authentication and role-based access control for travelers, guides, hotel owners, and administrators. Core functionalities encompass an online guide booking system with verified profiles, a hotel accommodation reservation system, and adventure package management, all supported by an AI-powered chatbot for personalized destination recommendations. To ensure smooth and secure operations, the system integrates the eSewa payment gateway for digital transactions, features email notification services for OTP verification and booking updates, and provides a centralized administrative dashboard for monitoring users, payments, and platform activities. This project is strictly focused on digital software implementation and explicitly excludes physical tourism infrastructure management or government-level integration during its current development phase.

1.5 Significance of the Project

The Ghumanthey project is significant because it addresses the issues that visitors to Nepal encounter. Finding reliable guides, reliable information, and secure accommodation is a challenge for many tourists. This initiative offers a single digital platform that facilitates and enhances their travel experience. By providing vetted guides, travel recommendations, and lodging alternatives, it provides travelers with comfort and safety. Quick responses and clear travel planning are made simple by the chatbot. Ghumanthey gives the locals a chance to interact with tourists through guides and service providers. This boosts the local economy and enables them to make money. In terms of technology, the project employs chatbot systems and contemporary technologies like Java Spring Boot to address practical issues. This makes it a positive step in the direction of tourism's digital growth. All things considered, Ghumanthey is significant because it promotes tourism in Nepal, helps locals, conserves culture, and uses technology to promote sustainable growth.

CHAPTER 2

LITERATURE REVIEW

2.1 Review of Existing Systems / Products

Tourism is a major part of Nepal's economy, bringing in foreign money and creating many local jobs. Globally, travelers now use online platforms to plan trips, book rooms, and find guides. According to (Revfine, 2023), technology is essential for running tourism businesses smoothly and making travelers happy. However, Nepal's tourism sector still suffers from scattered services, a lack of trusted guide verification systems, and poor digital tools for local businesses. (Jeong, 2016) pointed out that this weak digital presence stops local businesses from making good money from international tourists.

Global websites like (Steinert, 2000) and (GetYourGuide, <https://www.getyourguide.com/>, 2009-2010) are great at combining hotel bookings and reviews. However, they focus on international markets and do not have local background checks for guides in Nepal. On the other hand, local sites like the Nepal (Board T. , 1998), (Nepal, <https://www.visitnepal.com/>, 2020)), and Hamro Trip only provide static travel articles. They lack active features like instant guide booking, online payments, or AI support.

Recent research shows that modern tourism sites need to be smart and highly scalable. (N. V. Prem Kumar, 2023) explained how intelligent web apps can connect tourists directly to independent local guides, giving everyone a fair chance. Additionally, (Gurdeep Singh, 2021) showed that direct-booking systems build strong trust with consumers by cutting out confusing middleman fees.

Modern systems also require strong, secure backend designs. A study in the ((2025), 2025) proved that cloud-based systems can safely link hotels, transportation, and guides together in real time. This technical safety is vital; (Shrestha A. , 2020) argued that because Nepal has challenging geographical terrain, a secure digital tracking and verification framework is necessary to keep tourists safe.

Furthermore, a study on Nepal's heritage cities (2026) revealed that local guides in Kathmandu and Pokhara succeed much faster when they use simple, unified digital platforms. However, (Kharel, 2019) noted that while small Nepalese tourism businesses use social media, most of them are still too slow to adopt fully automated e-commerce and booking platforms.

Industry reports from (TourHQ, Bokun, 2012), Bokun, and (S.L., 2002) show that hiring local guides helps the local economy, but it only works if bookings are instant and transparent. This supports the findings of (Paudel K. P., 2019), who stated that Nepal's tourism needs to modernize quickly with local payment options and verified tracking to ensure reliability.

In conclusion, global platforms lack local verification, and Nepalese websites lack automated booking features. There is currently no unified platform for Nepal that combines verified guide booking, hotel reservations, AI help, and secure local payments. The *Ghumantey* project aims to fix this gap by building a user-friendly, secure, and smart digital tourism platform tailored specifically for Nepal.

2.2. Research Gap

The digital environment of Nepalese tourism shows a large gap between the country's high travel potential and its weak existing infrastructure. This problem can be broken into four major gaps:

- **The Verification Vacuum:** Global platforms like TripAdvisor and GetYourGuide are great at collecting general hotel reviews, but they leave a local security gap. They do not check if local guides have legal certifications or professional training. This forces tourists to manage safety and quality issues completely on their own.
- **The Fragmentation Gap:** On the other hand, domestic sites like Visit Nepal and Hamro Trip act only as static information centers. They give basic travel details but lack an interconnected network. Because they do not have real-time booking systems or secure local payment gateways, tourists cannot transact directly with service providers.

- **The Technological Gap:** Most existing local platforms rely only on one-way information sharing. They lack modern interactive elements—such as AI-powered assistance—which are highly necessary to help travelers handle dynamic itineraries or sudden language barriers on the ground.
- **The Economic Empowerment Gap:** Because there is no unified marketplace, local guides and small hotel owners are often cut off from the main digital economy. This means local communities miss out on direct tourism earnings, which instead go to foreign middlemen.

The Ghumantey Solution: Ghumantey addresses these precise gaps by turning theoretical digital ideas into a practical, secure reality. By combining a marketplace of strictly verified local guides with interactive AI support and direct eSewa payment integration, the platform establishes a unified, reliable travel ecosystem. It moves past static information, building a safe and transparent connection that protects global travelers while directly supporting the local community.

2.3 Comparative Analysis

A comparative study of three distinct approaches to tourism management—Global Online Travel Agencies (OTAs), Static Domestic Portals, and the proposed *Ghumantey* platform—is discussed below according to their features, technical architecture, and usability.

Table 1: Comparative Analysis of Existing Tourism Management Systems

Feature	Global OTAs (e.g., TripAdvisor, GetYourGuide)	Static Domestic Portals (e.g., Visit Nepal, Hamro Trip)	Proposed Ghumantey Platform
Technology Used	Global cloud networks, commercial booking engines, localized algorithms	Legacy web servers, simple HTML/CSS frameworks, static content databases	Java Spring Boot, MySQL database layer, Tailwind CSS, AI Engine

Feature	Global OTAs (e.g., TripAdvisor, GetYourGuide)	Static Domestic Portals (e.g., Visit Nepal, Hamro Trip)	Proposed Ghumantey Platform
Guide Verification	Missing or open self-registration; lacks local background validation	None (no active guide listings available)	Strict manual/legal document verification by platform admins
Transaction Method	International credit cards, PayPal, Google Pay	None (purely informational)	Integrated eSewa gateway with secure HMAC-SHA256 signatures
AI Support	Generic keyword-based help centers or basic support bots	Integrated using Ollama server	AI-powered chatbot for dynamic itineraries and recommendations
System Real-Time Capabilities	Real-time global booking systems but minimal local-level guide tracking	Static content with completely manual, offline coordination	Real-time digital booking, active schedule dashboards, automatic OTP services
Economic Impact	High service fees that keep tourism profits in foreign corporate hands	Zero direct transaction enablement for local vendors	Direct peer-to-peer ecosystem that sends profits directly to local providers
User Notifications	Email and standard app push notifications	Integrated	Automated Email notification system for OTPs, confirmations, and billing

A comparison of Global OTAs, Static Domestic Portals and the proposed Ghumantey management system is shown in Table 1. It highlights the differences in technology features, security and size. Global OTAs like TripAdvisor and GetYourGuide are established digital platforms that are good at collecting international user reviews and booking travel. However they use verification rules, which create a big security gap for local tour guides. These systems do not have connections to local authorities or licensing boards in Nepal. As a result they cannot check if a local guide is legally certified or professionally trained. This forces tourists to take all safety risks. On the hand local websites like Visit Nepal and Hamro Trip serve as basic information portals. They are useful for destination marketing but lack the necessary features for booking. They do not offer automated guide bookings booking management dashboards or secure payment options. This forces tourists to rely on offline agreements or cash payments. The proposed Ghumantey platform solves these problems. It builds a localized application that combines different travel services. Ghumantey offers verified guide bookings, hotel room reservations and activity listings in a secure environment. It uses Java Spring Boot and a scalable MySQL database. Ghumantey also focuses on usability and local integration. It allows tourists to make payments easily by using the eSewa payment gateway. The platform also has an AI-powered travel assistant. This assistant guides tourists through travel scheduling and instant destination filtering. Unlike systems Ghumantey supports local economic growth. It connects travelers directly with verified local guides and small-scale Nepalese hotel owners. This ensures that tourism profits stay within the economy. Ghumantey uses access controls to manage this process. The platform protects the travel ecosystem. The Ghumantey management system is an option for tourists and local businesses. It provides an reliable way, to book travel services. The platform also promotes economic growth. The proposed Ghumantey platform directly solves the limitations of Global OTAs and Static Domestic Portals. The Ghumantey platform is an localized application. The platform combines travel verticals into a single secure environment. The Ghumantey management system is an option.

CHAPTER 3

SYSTEM ANALYSIS AND DESIGN

3.1. Feasibility Study

3.1.1. Technical Feasibility

The Ghumanthey system is totally doable from a technical standpoint. It uses some pretty standard technologies like Java Spring Boot and MySQL, which are great for building secure and scalable web applications. Plus, the fact that it can integrate eSewa payments using HMAC-SHA256 encryption shows that it's possible to have secure online transactions. And with a stable internet connection, it's also feasible to integrate a chatbot using APIs like Gemini or OpenAI. This is because these technologies are widely used and well-established, making it easier to implement them in a system like Ghumanthey. Overall, the use of modern technologies and secure encryption methods makes the Ghumanthey system a viable option for building a robust and secure web application.

3.1.2. Economic Feasibility

The project makes sense financially, thanks to the booming tourism industry in Nepal and the fact that more and more people are using digital services. One of the reasons it's not too expensive to develop is that it uses open-source technologies and gets help from students. Plus, the platform has a good chance of making money in the future through things like booking commissions and partnerships with tourism companies. This is a big plus, as it means the project could bring in some extra revenue down the line. Overall, the project seems like a smart investment, given the growing demand for digital services in Nepal and the potential for future growth.

3.1.3 Operational Feasibility

The system is operationally feasible because it provides a simple and user-friendly platform for travelers, guides, and administrators. The centralized dashboard allows efficient management of bookings, users, and tourism services. Additionally, the

verified guide system supports Nepal's tourism modernization goals and improves traveler trust and safety.

3.1.4. Legal & Regulatory Feasibility

The Ghumantey platform is able to work within the law by following all the rules and regulations for e-commerce and tourism in Nepal. To keep users safe, the system has secure ways to check who people are, like using one-time passwords and encrypting data. Also, the guides and hotels listed on the platform can be checked to make sure they have the right licenses and meet the government's requirements. This helps build trust with users and makes sure everyone is following the rules. By doing things this way, Ghumantey can provide a reliable and secure service for people to book guides and hotels.

3.1.5. Schedule Feasibility

The deadline for our project is realistic and can be met within the timeframe of the Final Year Project. This is because we've already finished some of the big parts, like getting users to log in, making bookings, and sorting out payments. Now we just need to work on the smaller things, like the AI chatbot and the dashboard, which can be done bit by bit while we're still in school.

3.2 Requirements Specification:

3.2.1. Functional Requirements (FR):

- **Multi-Role Authentication and Authorization:** The system shall provide secure login and registration functionality for different users such as Travelers, Guides, Hotel Owners, and Administrators. Role-Based Access Control (RBAC) will ensure that users can access only authorized modules and features.
- **Guide and Hotel Booking System:** Users shall be able to search, view, and book tourist guides, hotels, and adventure activities through an easy-to-use online booking system. The system will provide real-time booking and availability management.

- **Integrated eSewa Payment Gateway:** We've made it easy to pay online with our integrated eSewa payment system. This system uses a special kind of security check called HMAC-SHA256 to make sure all your transactions are safe and secure. When you make a payment, you'll get a confirmation right away, so you can be sure everything went through smoothly..
- **Advanced AI Chatbot:** The system shall include an AI chatbot integrated using Spring AI and Ollama to assist users with travel-related queries, destination recommendations, hotel suggestions, guide information, and basic itinerary planning.
- **Automated Mail Service:** The platform shall automatically send email notifications such as registration confirmation, booking receipts, OTP verification codes, booking updates, and payment confirmations.
- **Administrative "Dashboard":** The system shall provide an admin dashboard for managing users, guides, hotels, bookings, payments, and system activities. Administrators can monitor and control the overall platform operations.
- **File Upload and Resource Management:** Guides and hotels shall be able to upload profile images and related resources dynamically through the system. Uploaded files will be managed securely by the backend server.

3.2.2. Non-Functional Requirements (NFR):

- **Robust Security:** The system shall implement Spring Security with Role-Based Access Control (RBAC), secure authentication, session management, and encrypted communication to protect user data and payment information.
- **High Availability:** The platform must maintain an uptime of 99.9%, ensuring travelers can access their booking information and the AI chatbot 24/7.
- **Cross-Platform Usability:** The design (using Tailwind CSS) should look great and work perfectly on phones, tablets, and computers. This means it needs to adjust its layout to fit different screen sizes, so it's easy to use no matter what device you're on.

- **Performance:** The platform shall provide fast response time for user requests such as login, booking, payment processing, and chatbot interaction to ensure smooth user experience.
- **Usability:** The user interface shall be responsive, user-friendly, and easy to navigate across desktop, tablet, and mobile devices.

3.3. System Design of Ghumantey

Ghumantey's system design describes the application's architecture and structure. It describes how the system's many components work together to create a seamless and efficient tourist guide booking experience. The system has a three-tier architecture, with the display layer, the application layer, and the data layer.

3.3.1. Presentation Layer (Frontend):

The presentation layer is what you see when you use a system - it's the user interface. This layer is built using HTML, CSS, like Tailwind CSS, and JavaScript. It's how you interact with the app, whether you're searching for guides, booking a hotel, looking into activities for your trip, or chatting with the AI chatbot. Basically, it takes what you're asking for and sends it to the backend, then shows you the answers it gets from the server.

3.3.2. Application Layer (Backend):

The application layer, created with Java Spring Boot, manages all of the system's fundamental operations. It handles user requests, controls business logic, and guarantees correct communication between the frontend and the database. This layer handles user authentication, booking management, data processing, and administrative functions. It offers RESTful APIs for usage by the frontend.

3.3.3. AI Chatbot Integration:

To improve the user experience, Ghumantey incorporates an AI-powered chatbot built using Spring AI. The chatbot serves users by answering travel-related questions, recommending places, and offering advice. It communicates with the backend services to retrieve necessary data and provide intelligent replies.

3.3.4. Admin Module:

The platform has a special control panel for people in charge, making it easy for them to manage everything. These administrators can add new things, change old things, or get rid of things they don't need anymore - like information about guides, hotels, and activities. They can also keep an eye on bookings and take care of user information. This part of the system helps make sure everything runs smoothly and is taken care of properly.

3.3.5. Data Layer (Database):

The data layer is where all the information for the application is kept. This includes things like user details, information about tour guides, hotels, reservations, and activities. To store and get this data efficiently, a relational database like MySQL is used. The backend of the application talks to this database to perform basic actions like creating, reading, updating, and deleting data.

Fig: Database Schema Ghumantey

Fig: Database Schema of Ghumantey

3.3.6. Data Flow of the System:

The Ghumantey platform is based on a structured, multi-tier data flow that ensures both security and real-time response. When a user interacts with the frontend whether looking for a verified guide or making a hotel reservation request is sent to the Java Spring Boot backend using RESTful APIs. The backend serves as the core orchestrator, carrying out critical business logic such as session validation and price computations while communicating with the MySQL database to obtain or save data. For specialized operations like financial transactions, the data flow extends to external services like the eSewa API, where secure signatures are validated before the booking is confirmed by the backend. Once processing is complete, the system sends a structured response back to the frontend, which dynamically updates the dashboard to provide the user with immediate, accurate feedback.

3.3.7. Advantages of the Design:

Ghumantey's system architecture provides scalability, maintainability, and efficiency. The separation of layers enables easy customization and future improvements. It also increases system speed and enhances the user experience.

3.4.1. Flow-Chart for “Ghumantey”:

Fig 3.4.1: Flowchart Ghumantey

When a traveler books a service, they start by choosing a category and entering their trip details - like the number of people, date, and time - into a dynamic form on the website. This form instantly calculates the total cost, so the traveler knows exactly what to expect. To make sure everything runs smoothly and no data gets lost, the system immediately starts a transaction in the database and gives it a temporary "pending" status. It also generates a unique ID and a secure digital signature to keep everything safe. Next, the traveler is redirected to a secure payment gateway to complete their payment. If something goes wrong, they'll be sent to a failure page. But if everything goes smoothly, the system checks the digital signature to make sure it's legitimate, updates the transaction status to "paid", and shows the traveler their confirmed itinerary. To keep the whole platform running securely, there's an admin dashboard that controls who can do what. It's like a security filter that reviews and approves new guide and hotel profiles before they're available to the public. This way, the platform can maintain its integrity and ensure that everything runs safely and smoothly.

3.4.2 Class Diagram for “Ghumantey”:

Fig 3.4.2: Class Diagram Ghumantey

The core of our system is the Booking class, which is really important because it keeps track of things like the booking ID, date, and status. It also controls what happens during a trip, from creating a booking to canceling one. This class is connected to four other main classes. The User class is one of them, and it's in charge of account details and making sure users can log in and register. One user can make many bookings, so we have a special relationship between the User and Booking classes. Then there's the Guide class, which handles all the information about guides, like their profiles, what they specialize in, and when they're available. Guides can also have many bookings, just like users. We also have the Payment class, which takes care of all the financial stuff. Every booking has exactly one payment record, so this class is closely tied to the Booking class. Lastly, there's the Review class, which is where users can leave feedback after a trip. A user can leave either no review or just one review for a booking, so we have a special rule in place for this. All these classes work together to make our system run smoothly. The Booking class is at the center, and it helps us keep track of everything that's going on.

3.4.3. Sequence Diagram for “Ghumantey”:

Fig 3.4.3: Sequence Diagram for Ghumantey.

When you click "Book & Pay" on the Ghumantey website, it starts a payment process. This happens when your web browser sends a message to the website's server, which then gets the payment process going. The server uses a secret code to create a special signature, kind of like a digital fingerprint, to keep your payment safe. It then sends this signature, along with the total amount you need to pay and a unique transaction ID, back to your web browser. Your browser then takes you to the eSewa payment page, where you can safely enter your payment details. Once you've paid, the eSewa system sends a message back to the Ghumantey server to say that the payment was successful. The server checks this message to make sure it's genuine and not fake. If everything looks good, the server updates its database to say that the payment has been made, and sends a message back to your browser to say that everything is okay. Finally, the Ghumantey website shows you a confirmation page to say that your trip is booked and paid for. This whole process

happens quickly and securely, so you can be sure that your payment is safe. The payment process involves several steps, but it's designed to be easy to use and to keep your payment details secure. Here's what happens in more detail: You click "Book & Pay" on the Ghumantey website, which sends a message to the server. The server creates a special signature to keep your payment safe, and sends it back to your browser. Your browser takes you to the eSewa payment page, where you enter your payment details. Once you've paid, the eSewa system sends a message back to the Ghumantey server. The server checks this message to make sure it's genuine and updates its database to say that the payment has been made. The server sends a message back to your browser to say that everything is okay, and the Ghumantey website shows you a confirmation page. This process is designed to be secure and easy to use, so you can book and pay for your trip with confidence.

3.4.5. “Ghumantey” System Architecture:

Fig 3.4.5: System Architecture of Ghumantey.

The application is made up of three main parts that work together. The first part is like a doorway where users and administrators can access the system. This is done through a special gateway that checks to make sure only authorized people can get in. It's like a security guard that makes sure everyone has the right permission to do what they need to do. Administrators have special tools to help them manage the system, like checking to make sure guides are verified and keeping an eye on transactions. Once someone is in the system, their requests are sent to the second part, which is like a translator. It takes the requests and turns them into a language that the system can understand and then sends the answers back in a standard format. This part of the system also talks to other services, like a chatbot that helps with recommendations and a payment gateway that handles financial transactions. The chatbot is like a personal assistant that suggests destinations, and the payment gateway is like a secure cashier that handles all the money transactions. Finally, the third part of the system is like the brain that makes everything work together. It's

where all the business logic happens, like checking if a guide is available or making sure a booking is processed correctly. It uses a special tool to talk to the database, which is like a big filing cabinet that stores all the important information. The database has all the information about users, guides, accommodations, bookings, and financial transactions, and it's all organized in a way that makes it easy to access and use. This is where all the critical data is stored, and it's protected by strong security measures to make sure everything stays safe. Overall, the system is designed to be secure, efficient, and easy to use, with each part working together to make sure everything runs smoothly.

3.4.6. ER-Diagram

Fig 3.4.6: ER-Diagram of Ghumantey.

The database is built around a flexible system where each user's information is stored in a main table called UserDetails. This table has all the basic details like id, name, email, and phone number for every person using the platform. To control what each user can do, the UserDetails table is connected to another table called UserRole. This connection helps map each user to specific roles like tourist, guide, hotel owner, or admin, making it easy to check permissions when a user logs in. For people who offer services, like guides or hotel owners, their information is stored in separate tables that are linked to the UserDetails table. For example, a guide's professional information, such as their license number, years of experience, and verification status, is stored in a Guide table. This table is connected to the UserDetails table in such a way that one user account can be linked to one guide profile, but not every user has to be a guide. Similarly, hotel information, including the hotel's name, location, and customer rating, is stored in a Hotel table. This table is connected to the UserDetails table in a way that allows one hotel owner to manage

multiple hotels, but each hotel can only have one owner. This setup helps keep the database organized and makes it easier to manage user roles and permissions

3.4.7. DFD-Diagram Level 0

Fig 3.4.7: DFD level 0 of Ghumantey

The Ghumantey Tourism Platform is like a big system that interacts with different groups of people and things outside of it. There are five main groups that it talks to: the Traveler, the Guide, the Hotel Owner, the Admin, and the Payment Gateway. The Traveler is like a customer who looks for things on the platform, picks what they want, and pays for it. They send messages to the platform saying what they're looking for, what they want to book, and when they're ready to pay. Then, the platform sends them back information that says "yes, you're booked" and gives them a summary of their trip. The Guide and the Hotel Owner are like the people who offer things on the platform. They send the platform information about themselves, like who they are and what they can offer, and they say when they're available. Then, when someone wants to book something, the platform tells them and they get a message saying someone wants to book with them. The Admin is like the person in charge who makes sure everything runs smoothly. They can control who gets to use the platform, they check to make sure the people offering things are who they say they are, and they can even change what's offered on the platform. They also

get to see how well the platform is doing and if there are any problems. Finally, there's the Payment Gateway, which is like a special helper that makes sure payments are safe and secure. When someone wants to pay for something, the platform sends a message to the Payment Gateway, which then checks to make sure the payment is okay and sends back a message saying everything is fine. This way, the booking can be finalized and everyone knows it's secure. So, all these different groups work together to make the Ghumantey Tourism Platform run smoothly and help people find and book trips.

3.4.7.1 DFD-Diagram Level 1

Fig 3.4.7.1: DFD level 1 of Ghumantey

The Level 1 diagram breaks the main system down into three primary operational sub-processes and identifies where information is permanently stored:

Search & Booking Services: Handles the front-facing logic for all users. It reads from and writes to the **D1: User Profiles** data store.

Payment Processing: Orchestrates transactions when triggered by a booking request. It relies on **D1: Listing Data**, **D2: Listing Data**, and logs transactional outcomes directly into **D4: Financial Trans.**

Reports & Analytics: Continuously tracks system operations to feed the administrative dashboard and compile performance metrics.

3.4.7.2. DFD-Diagram Level 2

Fig 3.4.7.1: DFD level 2 of Ghumantey

The Level 1 Data Flow Diagram breaks the main system down into three primary operational sub-processes supported by specialized, permanent data repositories. At the front end, 2.0 Search & Booking Services handles all consumer-facing logic, reading account credentials and writing registration metrics directly to the D1: User Profiles data store. When a traveler initiates a checkout, 3.0 Payment Processing orchestrates the financial transaction by validating details against marketplace availability in D1: Listing Data and D2: Listing Data, subsequently logging all immutable transactional outcomes directly into D4: Financial Trans. Concurrently, 4.0 Reports & Analytics continuously monitors platform operations, pulling active reservation logs and payment histories to feed the admin dashboard and compile high-level performance metrics for platform governance

3.4.7.3. DFD-Diagram Level 3

Fig 3.4.7.1: DFD level 3 of Ghumantey

This Level 2 Data Flow Diagram maps out the micro-logic inside process 2.2, defining the exact sequential steps required to finalize a reservation. The loop begins with 2.2.1 Validate Input Data, which sanitizes incoming traveler parameters to prevent invalid or malicious database writes. Once the inputs are cleared, 2.2.2 Check Listing Availability queries provider inventories in real time to ensure the requested guide or hotel room isn't double-booked. If the slot is open, 2.2.3 Generate Unique Booking ID creates a randomized, secure tracking token linked directly with the D2 data stores. From there, 2.2.4 Store Booking Details permanently writes the finalized reservation data matrix into the system's storage blocks under a temporary pending state. Finally, 2.2.5 Initiate Payment Request takes the initialized record and pushes the structured data payload to the external gateway system to kick off the cryptographic financial verification loop.

CHAPTER 4

IMPLEMENTATION PLAN

4.1 Development Methodology

Ghumantey was developed using the Agile Software Development Methodology, which supports iterative, flexible, and incremental development. Agile was chosen because the project contains multiple modules such as authentication, booking management, payment integration, AI chatbot functionality, and dashboard management, which are easier to develop and test in smaller stages. The project was broken down into smaller parts, with each part - or module - being worked on, tested, and made better one step at a time. This way of doing things, where we make a little progress, check it, and then make a little more, really helped us catch mistakes early on. It also made the whole system more reliable and easier to work with, because we weren't trying to tackle everything all at once. The agile approach gave us the freedom to make changes and improvements to features as we went along, based on what we learned from testing and feedback. We tested and debugged each part of the system regularly, to make sure everything worked together seamlessly - the user interface, the backend, the database, and external services like the eSewa payment gateway. This helped us catch and fix any issues early on, and made sure all the different components worked smoothly together. The approach also made it possible for different teams to work on various parts of the system at the same time, like the user interface, the backend, the database, and the AI chatbot. This meant that everything could be developed in parallel, which made the whole process more efficient and got the project finished faster. The Agile method really made a difference in creating a tourism platform that can grow, is easy to maintain, and simple for users to navigate. It also helped us keep making improvements all the way through the project.

4.2 Module Breakdown

The system is divided into several functional modules for better organization and development:

- **User Module:** The User Module manages user registration, login, profile management, and authentication. Users can search for guides, hotels, and adventure packages, make bookings, and manage their personal information through the dashboard.
- **Guide Management Module:** This module handles guide registration, profile management, availability status, pricing, and booking management. Guides can update their information and manage booking requests from tourists.
- **Hotel Management Module:** The Hotel Module manages hotel listings, room details, pricing, availability, and booking records. Hotel owners can add and update hotel information through their dashboard.
- **Booking and Cart Module:** The Booking Module allows users to add services to cart, confirm bookings, and manage booking history. It handles guide booking, hotel booking, and adventure activity reservations.
- **AI Chatbot Module:** The AI Chatbot Module is integrated using Spring AI and Ollama. It provides intelligent responses for tourism-related questions, destination suggestions, guide recommendations, and travel assistance.
- **Admin Module:** The Admin Module provides centralized control for managing users, guides, hotels, bookings, payments, and platform activities. Administrators can monitor system performance and manage overall operations.
- **File Upload and Resource Management Module:** This module manages dynamic image uploads for guides and hotels. It securely stores and retrieves uploaded resources using Spring Boot resource handling mechanisms.

4.3 Tools, Platforms, and Languages

The development of Ghumantey uses modern tools and technologies:

- **Frontend:** HTML, CSS (Tailwind CSS), JavaScript (used for designing user interface and user interaction)

- **Backend:** Java Spring Boot (used for handling business logic and APIs)
- **Database:** MySQL (used for storing and managing data)
- **AI Integration:** Spring AI (used for chatbot and intelligent responses)
- **Development Tools:** IntelliJ IDEA and Eclipse (used for coding and development)
- **Version Control:** Git and GitHub (used for code management and collaboration)
- **Platform:** Web-based application (accessible through web browsers)

4.4. PROJECT TIMELINE (GANTT CHART)

4.5. RISK ANALYSIS

Risk Description	Likelihood	Severity	Impact	Mitigation Strategy
Delay in frontend development due to design complexity	Medium	High	High	Use Agile sprints; divide UI into smaller components with reusable Tailwind templates.
Integration issues between Spring Boot backend and AI chatbot	High	High	High	Test APIs independently; use mock endpoints early; isolate AI module.
eSewa payment gateway integration failure	Medium	Medium	High	Use eSewa sandbox for early testing; implement fallback error-handling flows.
Database crash or data loss during deployment	Low	High	High	Regular automated backups; test on local environment before hosting.
Security vulnerabilities (unauthorized access, JWT bypass)	Medium	High	High	Enforce Spring Security; use HTTPS; rotate JWT secrets; conduct VAPT.
Performance bottlenecks with concurrent users	Medium	Medium	Medium	Optimize SQL queries; implement

				caching; load test before launch.
Scope creep due to new feature requests	High	Medium	Medium	Strict sprint planning; document scope boundaries; use change-request process.

CHAPTER 5

EXPECTED OUTCOMES AND LIMITATIONS

5.1 Expected Product Features

The Ghumantey system is expected to provide the following features:

- **Secure Multi-Role Authentication:** JWT-secured registration and login for Tourists, Guides, Hotel Owners, and Admins, with email OTP verification for account recovery and Spring Security RBAC enforcement.
- **Guide Discovery and Booking:** A searchable, filterable directory of GhumVerified guides with detailed profiles, availability calendars, pricing, and a seamless booking flow with email confirmation.
- **Hotel Reservation System:** A browsable accommodation marketplace with room-level detail pages, availability management, and integrated booking and payment processing.
- **eSewa Payment Processing:** Secure, signature-verified payment flows supporting Nepal's dominant digital wallet, with real-time booking status updates on payment success or failure callbacks.
- **AI Travel Assistant:** An embedded Spring AI chatbot providing contextual travel guidance, destination information, itinerary suggestions, and booking assistance in real-time.
- **Role-Specific Dashboards:** Tailored management interfaces for each user type — tourist booking history, guide reservation calendar, hotel occupancy tracking, and admin oversight panel.
- **Admin Verification and Oversight:** A complete control panel that lets you manage everything. You can check licenses, control user accounts, track bookings, analyze revenue, and oversee the entire platform. This helps you stay on top of things and make sure everything runs smoothly.
- **Modular Scalable Architecture:** A Spring Boot service-layer architecture enabling independent module updates, horizontal scaling, and future feature additions without architectural refactoring.

5.2. User Benefits and Impacts

- **Tourists:** For travelers, having a trusted and all-in-one marketplace for guides, hotels, and adventures makes a big difference. It saves them from searching through many different websites and reduces the risk of using services that are not reliable. This way, tourists can easily find and book what they need, without the hassle of dealing with multiple sources. It's like having a one-stop shop for all their travel needs, where they can feel safe and confident in their choices.
- **Local Guides:** A digital platform that provides market visibility beyond their immediate geographic network, automated booking management, and direct payment processing — reducing dependency on commission-heavy intermediaries.
- **Hotel Owners:** A self-managed listing system that gives small properties in remote regions digital presence and booking capability previously accessible only through expensive OTA platforms.
- **Local Economy:** When a platform keeps commission rates low and uses eSewa for payments, it helps make sure that the money from tourism stays in Nepal's economy. This way, the money doesn't go out of the country through foreign payment systems. Instead, it circulates within Nepal, which is good for the local economy.
- **Administrators:** Centralized oversight tools with real-time data visibility, enabling efficient platform management, quality control through guide verification, and data-driven policy decisions.
- **Environmental and Cultural Impact:** By directing tourists toward verified local guides and community-based operators, the platform promotes responsible tourism and cultural preservation over mass-market, impersonal travel experiences.

5.3. Limitations of the System

- **Online Platform:** Right now, the system is set up to work only through a web browser. The problem is, there's no app for mobile devices like iPhones or

Android phones. This makes it hard for people in Nepal to use, especially since more people are using their smartphones to access the internet.

- **No Real-Time Location Tracking:** Right now, the system doesn't allow for live tracking of guides during tours. This would be a great feature to have, as it would make tourists feel safer and give them a better idea of what's going on. However, to make this happen, we'd need to set up the right infrastructure for our mobile app.
- **Single Payment Option:** Right now, Ghumantey only works with eSewa. This is a problem for international tourists who don't have a Nepali digital wallet - they can't pay through the platform. This might stop some foreign visitors from using it. Ghumantey should think about adding more payment options so everyone can use it, no matter where they're from. This would make it easier for people to pay and might get more foreign visitors to use the platform.
- **English-Only Interface:** The platform is built in English only. The absence of Nepali language support may reduce accessibility for domestic guides and hotel owners with limited English proficiency.
- **Simulated AI Responses:** The Spring AI chatbot is really helpful, but its responses are limited by the Ollama model it uses. To get more detailed and useful answers, the model would need to be fine-tuned using data about tourism in Nepal. This would help the chatbot understand the specific needs and questions of people interested in visiting Nepal. By doing this, the chatbot could provide more accurate and helpful information, making it a better tool for people planning trips to Nepal.
- **Not being able to use it offline is a big issue:** since Ghumantey is a web-based application, you need a good internet connection to use it. This can be a problem in Nepal's remote trekking areas where the internet connection is not always stable. It's hard to use the platform when you're out in the field and can't get online.

CHAPTER 6

CONCLUSION

6.1. Summary of the Proposed Work

Ghumantey has come up with a great way to help people plan their trips to Nepal. They've made a website that does lots of things to make traveling easier. It helps you find guides, book hotels, plan adventures, and even get help from a computer program that can answer your questions. You can also pay for things online using eSewa, which is a safe and easy way to pay. All of these things are now in one place, making it simpler for people to plan their trips and have a good time in Nepal.

Our platform is built on a strong foundation, using Java Spring Boot for the backend. This gives us top-notch reliability and security, thanks to Spring Security and JWT authentication. We've also designed our service-layer architecture to be clean and modular, making it easy to develop and test each part independently. On the front end, we're using Tailwind CSS to create a responsive and accessible interface that looks great and works smoothly on all devices. But what really sets us apart is our integration with Spring AI, which powers an intelligent travel assistant that takes the user experience to the next level - something that no other Nepal-focused platform can match right now.

Tourism in Nepal has a big problem - people don't know if they can trust local tour operators. The GhumVerified guide certification system is trying to fix this. It creates a way to check if a tour operator is legitimate, which is run by the people in charge of the platform and follows the same rules as the Nepal Tourism Board. This gives tourists a sense of safety that big international companies can't provide when it comes to traveling in Nepal.

The system is currently set up as a web-based simulation that uses real transaction data. But it's designed to work in the real world too. It already has some key features that are ready to go, like the eSewa payment integration, a workflow to verify guides, and a dashboard for admins.

6.2. Future Scope

- **Mobile Application Development:** Native iOS and Android applications using React Native or Flutter, providing push notifications for booking confirmations, guide availability alerts, and in-app chat functionality.
- **GPS-Based Live Guide Tracking:** Real-time location sharing between tourists and their booked guides during active treks, implemented through the mobile application layer.
- **Multi-Language Support:** Nepali language interface to expand accessibility for domestic guides, hotel owners, and rural community operators who may not be comfortable in English.
- **International Payment Gateways:** Integration of Stripe and PayPal to support international tourists who do not hold eSewa accounts.
- **Advanced AI Recommendations:** Fine-tuning the AI model on Nepal-specific tourism datasets to provide more accurate destination recommendations, weather-aware itinerary suggestions, and multilingual assistance.
- **Smart City Tourism Integration:** Collaboration with Nepal Tourism Board and municipal authorities to integrate Ghumantey with official tourism data feeds, emergency alert systems, and regulated pricing databases.
- **Community Marketplace Expansion:** Addition of modules for local artisan marketplaces, handicraft sellers, and community homestay providers to extend the platform's economic impact beyond guides and hotels.
